The invention had the object of finding novel improved processes for the preparation of precursors of factor Xa inhibitors.

5 Compared with known processes from the prior art, the process according to the invention is shorter and more efficient.

10 Factor Xa inhibitors can be employed for combating and preventing thromboembolic diseases, such as thrombosis, myocardial infarction, arteriosclerosis, inflammation, apoplexy, angina pectoris, restenosis after angioplasty and claudicatio intermittens.

15 Factor Xa is one of the proteases involved in the complex process of blood coagulation. Factor Xa catalyses the conversion of prothrombin into thrombin. Thrombin cleaves fibrinogen into fibrin monomers, which, after cross-linking, make an elementary contribution to thrombus formation. Activation of thrombin may result in the occurrence of thromboembolic diseases.

20 However, inhibition of thrombin may inhibit the fibrin formation involved in thrombus formation.

The inhibition of thrombin can be measured, for example by the method of G. F. Cousins et al. in *Circulation* 1996, 94, 1705-1712.

25 Inhibition of factor Xa can thus prevent the formation of thrombin.

The inhibition of factor Xa and the measurement of the anticoagulant and antithrombotic activity can be determined by conventional in-vitro or in-vivo methods. A suitable method is described, for example, by J. Hauptmann et 30 al. in *Thrombosis and Haemostasis* 1990, 63, 220-223.

The inhibition of factor Xa can be measured, for example by the method of T. Hara et al. in *Thromb. Haemostas.* 1994, 71, 314-319.

Coagulation factor VIIa initiates the extrinsic part of the coagulation cascade after binding to tissue factor and contributes to the activation of factor X to give factor Xa. Inhibition of factor VIIa thus prevents the formation of factor Xa and thus subsequent thrombin formation.

- 5       The inhibition of factor VIIa and the measurement of the anticoagulant and antithrombotic activity can be determined by conventional in-vitro or in-vivo methods. A conventional method for the measurement of the inhibition of factor VIIa is described, for example, by H. F. Ronning et al. in *Thrombosis*  
10      *Research* 1996, 84, 73-81.

Coagulation factor IXa is generated in the intrinsic coagulation cascade and is likewise involved in the activation of factor X to give factor Xa. Inhibition of factor IXa can therefore prevent the formation of factor Xa in a  
15      different way.

- The inhibition of factor IXa and the measurement of the anticoagulant and antithrombotic activity can be determined by conventional in-vitro or in-vivo  
20      methods. A suitable method is described, for example, by J. Chang et al. in *Journal of Biological Chemistry* 1998, 273, 12089-12094.

A correlation between tissue factor TF / factor VIIa and the development of various types of cancer has been indicated by T.Taniguchi and  
25      N.R.Lemoine in Biomed. Health Res. (2000), 41 (Molecular Pathogenesis of Pancreatic Cancer), 57-59. The publications listed below describe an antitumoural action of TF-VII and factor Xa inhibitors for various types of tumour:

The following methods for the preparation of 2-(2-chloroethoxy)acetamides are known in the literature:

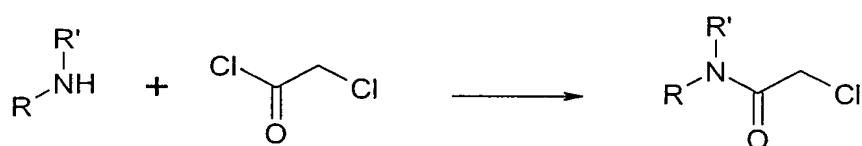

5

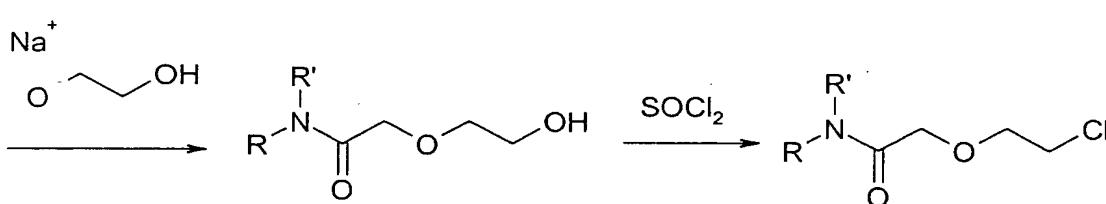

10

This method is described, for example, in US 3 074 939, BE 776767 and DE 1922613.

15

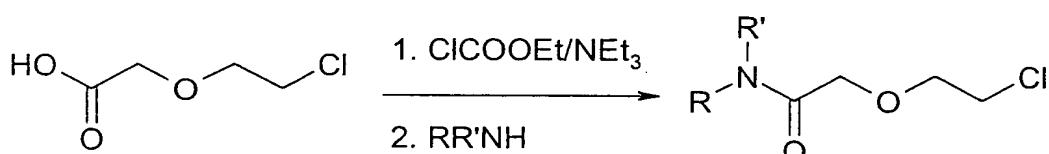

20

25

This method is described, for example, in G. May, D. Peteri, Arzneim.-Forsch. (Drug Res.) 23, 718 (1973).

30

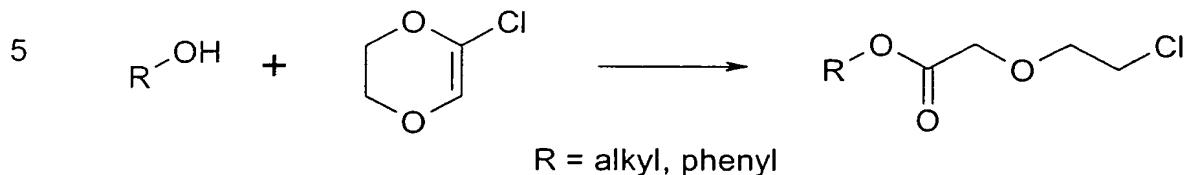

This method is described, for example, in DE 2150075.

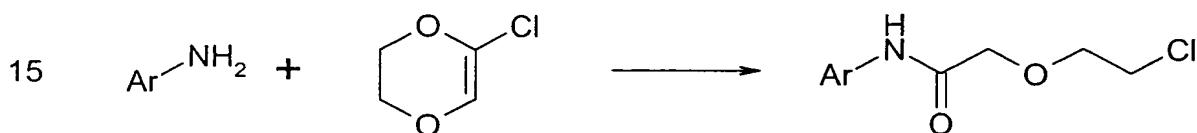

35

However, these methods have disadvantages. Thus, many reaction steps are necessary or the starting materials are expensive.

M. J. Astle, J. D. Welks, J. Org. Chem. 26, 4325 (1961) disclose the following reaction:

10      We have found, surprisingly, that arylamines, so long as they have a  $\text{pK}_a$  of less than or equal to 3, also react with 2-chlorodioxene to give 2-(2-chloroethoxy)acetamides.

20      In view of M. J. Astle, J. D. Welks, J. Org. Chem. 26, 4325 (1961), this is unexpected since amines, such as ammonia, benzylamine, 8-amino-quinoline or 4-methoxyaniline, do not react or react very poorly.

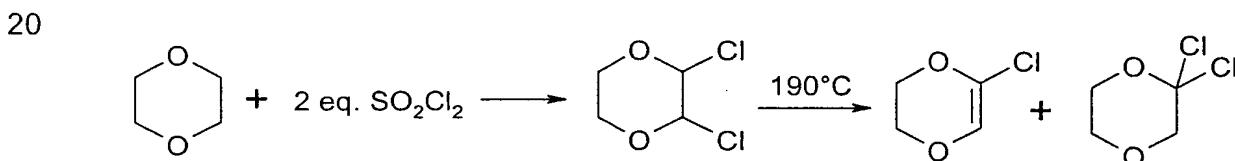

Comparison of  $\text{pK}_a$  values:

25	Benzylamine	9.5
	Ammonia	9.24
	8-Aminoquinoline	0.7 (NH <sub>2</sub> group) and 4.0 (quinoline nitrogen). The basic quinoline nitrogen prevents the reaction.
30	4-Methoxyaniline	5.4
	4-Nitroaniline	1.0
	4-Cyanoaniline	1.7
35	3-Nitroaniline	2.5
	2-Methyl-4-nitroaniline	1.04

Methyl 4-aminobenzoate	1.5
4-Aminobenzophenone	2.2
2-Nitroaniline	-0.23

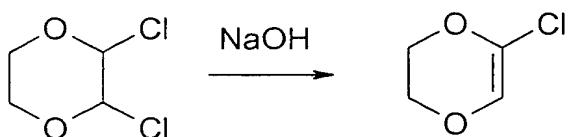

5 In the reaction, it is advantageous to add an acid, for example a Brönsted acid, such as hydrochloric acid, or a Lewis acid, or alternatively to add 2,2-dichlorodioxene, a compound which, as is known from the literature (R. K. Summerbell, H. E. Lunk, J. Am. Chem. Soc. 79, p.  
10 4802, 1957), readily dissociates into hydrogen chloride and 2-chlorodioxene. The reaction can be carried out in many solvents, for example toluene, acetonitrile, dioxane, but also in mass, i.e. without solvent. Typical reaction temperatures are 0 to 150°C, generally around 80°C,  
15 for example between 70 and 90°C.

The advantage of this process lies in the ready accessibility of 2-chlorodioxene or 2,2-dichlorodioxane.

25 The preparation of 2,3-dichlorodioxane is described, for example, in M. Iyoda et al, Heterocycles, 54, p. 833, 2001. The thermal elimination of hydrogen chloride is described in US 2 756 240. This method gives 2-chlorodioxene, which is contaminated with a certain proportion of 2,2-dichlorodioxane (typically 5 to 50%).  
30

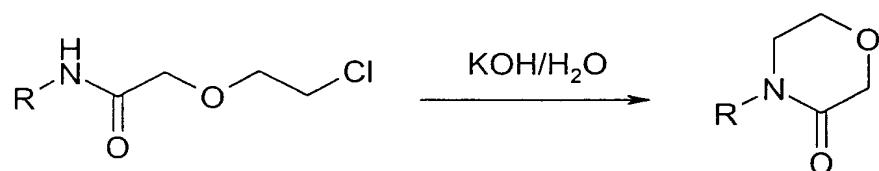

N. V. Kuznetsov, I. I. Krasavtsev, Sov. Prog. Chem. (Engl. Transl.) 44, p. 77, 1987, describe methods for the preparation of 2-chlorodioxene from 2,3-dichlorodioxane using sodium hydroxide.

5

The cyclisation of chloroethoxyacetamides to give morpholinones has hitherto only been described in two publications, in DE 922613 and L. Fumagalli et al. Pharmazie 30, 78 (1975). Both cases involve triiodobenzoic acid and triiodophenylalkanoic acid derivatives.

10

15

However, this process is only suitable for substrates which are water-soluble, as in the above documents, in which R always contains a free carboxyl group.

20

We have found that chloroethoxyacetamides can preferably be cyclised to give morpholinones using weak bases, such as, for example, caesium carbonate or potassium carbonate, in a suitable solvent, such as, for example, acetonitrile.

benzene; esters, such as ethyl acetate, or mixtures of the said solvents, particular preference is given to acetonitrile.

Process steps a) and b) can also be carried out as a one-pot reaction.

5 When the amine and 2-chlorodioxene have reacted completely, the temperature of the solution is lowered and an excess of alkali metal carbonate (typically 1.5 to 4 equivalents) is added and the reaction mixture is stirred until conversion is complete.

10 A base of the formula I can be converted into the associated acid-addition salt using an acid, for example by reaction of equivalent amounts of the base and the acid in an inert solvent, such as ethanol, followed by evapo-

15 ration. Suitable acids for this reaction are, in particular, those which give physiologically acceptable salts. Thus, it is possible to use inorganic acids, for example sulfuric acid, nitric acid, hydrohalic acids, such as hydrochloric acid or hydrobromic acid, phosphoric acids, such as orthophosphoric acid, sulfamic acid, furthermore organic acids, in particular aliphatic, alicyclic,

20 araliphatic, aromatic or heterocyclic mono- or polybasic carboxylic, sulfonic or sulfuric acids, for example formic acid, acetic acid, propionic acid, pivalic acid, diethylacetic acid, malonic acid, succinic acid, pimelic acid, fumaric acid, maleic acid, lactic acid, tartaric acid, malic acid, citric acid, gluconic

25 acid, ascorbic acid, nicotinic acid, isonicotinic acid, methane- or ethanesulfonic acid, ethanedisulfonic acid, 2-hydroxyethanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, naphthalenemono- and -disulfonic acids, laurylsulfuric acid. Salts with physiologically unacceptable acids, for example picrates, can be used for the isolation and/or puri-

30 fication of the compounds of the formula I.

On the other hand, compounds of the formula I can be converted into the corresponding metal salts, in particular alkali metal or alkaline earth metal salts, or into the corresponding ammonium salts using bases (for example

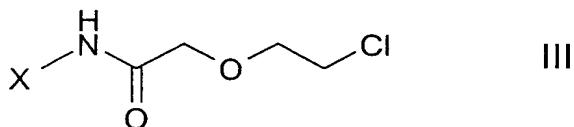

sodium hydroxide, potassium hydroxide, sodium carbonate or potassium carbonate).

It is also possible to use physiologically acceptable organic bases, such as, for example, ethanolamine.

### Example 1

The preparation is carried out analogously to the following scheme:

### 1.1 *without solvent:*

1.53 g of a mixture of 2-chlorodioxene and 2,2-dichlorodioxane (molar ratio 1:1) are added to 1.00 g (7.24 mmol) of 4-nitroaniline, and the mixture is heated to 80°C with stirring. A solid brown mass forms within one hour and becomes liquid again and crystallises within the following 12 hours. The crude product is recrystallised from ethanol with addition of water, giving 1.80 g of 2-(2-chloroethoxy)-N-(4-nitrophenyl)acetamide ("A1") as yellowish crystals, m.p. 101-102°C.  $^1\text{H-NMR}$  ( $\text{d}^6$ -DMSO):  $\delta$  = 3.82 (m; 4H), 4.23 (s; 2H), 7.91 (d,  $J$  = 9 Hz, 2H), 8.23 (d,  $J$  = 9 Hz, 2H), 10.34 (s, 1H).

### 1.2 *in acetonitrile:*

The reaction mixture is evaporated, and the residue is recrystallised from ethanol/water: 360 mg of "A1" as yellowish crystals.

1.3 1 kg of "A1" is dissolved in 5 litres of acetonitrile at room temperature, 835 g of potassium carbonate are added, and the mixture is stirred at

this temperature for 18 hours. The mixture is warmed to 50° and worked up analogously to Example 6, giving 4-(4-nitrophenyl)-3-oxomorpholine ("A2"), m.p. 150-152°.
